

for or against the artificial intelligence (AI) car	
for	against
One deadly accident caused by an AI car is nothing compared 40000 deaths on the road in the US last year.	It's not reassuring that there have already been serious accidents from the beginning of the testing of AI cars.
The pedestrian wasn't on the zebra crossing.	The AI failed to detect a person crossing the road. This is appalling.
Long term an AI car has the potential to increase safety on the road, if you stop the project because you will lose this potential.	It's a shame that we have already had one death, the project should be stopped to avoid further deaths.
That's why the deep learning method trains the algorithms to recognise all sorts of elements and instructions to analyse the different situations.	AI isn't able to react to every situation and to interpret all the human behaviour.
Recently, researchers are attempting to create sensors which are more accurate and secure.	Weather conditions such as rain, smog, fog or snow can lead to a malfunction of the cameras and radars.
If everybody respected the highway code this wouldn't be a problem.	In traffic jams AI cars may not move on due to it detecting many obstacles around it. An AI car will never break the law, therefore it might remain stationary even though obstacles on the road will necessitate the car to cross a yellow line or go through traffic lights that are out of order.
If everybody respected the highway code this wouldn't be a problem.	Sometimes in traffic jams drivers must can't respect the priority to the right, but AI will, and spend your whole day on the roundabout.
It is safer to let the AI drive	driving is fun
The AI truck can drive all at the same rhythm.	The road isn't adapted to allow AI cars to drive.
It will give autonomy to the drivers who can't have a driving license anymore.	Reduce the amount of lunatic drivers
AI cars can drive on country roads	AI cars can't drive on the motorway
AI cars will be able to assess what the car's problem is an maybe be repaired remotely.	If there is an electrical or mechanical problem you can't resolve it easily by the passenger.
The company of the car can see and take over if the car need's help	The car can be hacked without a steering wheel, you can't take control.
The AI won't provoke a lot of accidents	If there is an accident who is responsible, the passenger, the company, the car, the factory.
If you are drunk you will still drive well.	If it is dark the AI car might not be able to detect people and stop in time.
