

1) Obesity rates around the world are currently increasing. Do you think this will continue in the future?

I think it will increase because food on the planet will be less and less present. and that good quality food will be more expensive, so people won't necessarily have the economical funds to afford that and they will buy fast food which might be cheaper. This fast food isn't healthy and the amount of junky products that are put in it contains bad fat that your body will not necessarily digest. The amount of obese people will be much more important because they might not move as much as we did before. Knowing that people don't necessarily have good jobs might encourage them to consume bad quality food. Obesity might increase with the important amount of processed food. The fact that meat - such as beef, lamb and what we generally consume - might disappear and lead us to eat deep fried animals. These are the reasons that allow me to believe that obesity might increase in the future.

picture p 215:

On the picture in the foreground we can see snow and a snow man surrounded by two children. The snow man has a bucket representing a top hat a knows made out of a carrot a stick as a mouth and horse chestnuts as eyes. The children seem happy because their smiling, they are warmly dressed with gloves, a woolly hat, a warm coat. In the background we can see two trees to the right and a fence in the background. the atmosphere is joyful. My point of view is that children should continue having fun in the generations to come because it is important for children to enjoy themselves. Children should continue playing in nature and not on videogames because they will learn the art of being manual.
